- Particle physicists and cosmologists come up with weird ideas to explain the world . . .
- but material scientists (or engineers) don't care.

Why?

- A phenomenon can be well described by a theory that *fits its scale*
- **Effective theory**

Example 1

We can use quantum theories to predict the behavior of electrons ...¹

But the dynamics of molecule doesn't need full information concerning this: Atoms are seen as balls without inner structures.²

Example 2

Electrons repulse each other – Coulomb interaction³

But do you know this actually arises from changing photons (i.e. smallest unit of light)?

Effective theories are everywhere

- Molecular dynamics is an effective theory of quantum mechanics.
- Coulomb interaction is an effective theory of quantum electrodynamics.
- ...

A “complete” theory can also be an effective theory
General relativity

Conclusion

- A theory has
